

Statement about equity, diversity and inclusion with regard to research and teaching:

I classify myself as a liberal person; I do have decessive opinions about many things, but I believe this has nothing to do with work and specially the promoting of knowledge & science...

1-I myself learned a lot from online free courses from ranked universities and professors; I believe putting free material online and also discussion boards provide some form of learning and research equity for those who can't afford paying the registration fee of such courses. Hence, I naturally do the same and publicly share everything... my research, brainstorming, and even interesting material I happen to pass by through my navigation.

2-I try to use science & research to find solutions to real life problem; examples include my NFT paper, thinking about the integration of deceased donations to avoid living people donation and criminal activities around that, thinking of a media consortium blockchain to verify (using C2PA) & auction material before publishing it and keep the owner royalty rights,.... However, I admit that it is really hard for me to conduct a directed research on an imposed topic I didn't choose.

3-I as a person support Phalastine and against Israel; I even thought of a Metaverse challenge where people vote by buying virtual land. However, I believe this should not affect teaching & research; I unbiasedly read and learn from Israeli professors like Prof. Dan Boneh in the DeFi MOOC course and his latest paper where I learned about C2PA and thought about the media Blockchain idea, I also watched Prof. Tim Roughgarden lectures on Israel and Vitalik Buterin and a lot others.

4-My religion as a Moslem is strictly against LGBTQ⁺, I believe but not sure that Christianity is against it too, however I believe other people attitude is none of my business or concern. The way I see it why should I care if someone chose to go to hell as long as they don't harm me. Maybe if I had a children I would have much more worries and consider it to be a problem if they had some thoughts or queries with their friends at school, but I don't have any children; So my attitude will be simply to avoid them, and as for the students I don't think a professor- student relation should let me know anything about their personal lives to have any attitude about it.

»»» In short, regarding 3&4, I don't think my opinion/belief will be an obstacle in conducting research or equally treating students who have different beliefs, just I will not socialize with people against me.
